City life is challenged by the Belgian dream of a free-standing house in a garden – which might just be an architect's nightmare, as pictured by Hannes Coudenys in *Ugly Belgian Houses*.

Gérald Ledent and Alessandro Porotto

# Brussels Housing: A Typology

«Dans l'art de l'architecture, la maison est certainement ce qui caractérise le mieux les mœurs, les goûts et les usages d'une population; son ordonnance, comme ses distributions, ne se modifie qu'à la longue, et si puissants que soient des conquérants, leur tyrannie ne va jamais jusqu'à tenter de changer la forme des habitations du peuple conquis»

EUGÈNE EMMANUEL VIOLLET-LE-DUC<sup>1</sup>

## Housing

This book sets out to analyse and illustrate the various housing forms that exist in Brussels. This objective is undertaken from an architectural viewpoint by examining the spatial features of housing across the various phases of the city's evolution, from its origin to its golden age at the turn of the 20<sup>th</sup> century, and on to contemporary practice. In addition to documenting the qualities of housing itself, the book investigates the mechanisms that drove housing's evolution and the ways in which housing production has shaped the city.

The variety of housing forms in Brussels is vast, as are the continuing debates and private or public initiatives that have enriched them. Interestingly, discussions about housing quality have been revived in recent decades as a means to address several challenges: the city's growing population, climate change, and social inclusion. In addition, since the 1960s, Brussels' urban housing has developed in competition with that of the city's hinterland, which extends as far as the Belgian coast. The competition between the city and its periphery is fuelled by the tenacious dream many people have of living in a villa on an isolated plot of suburban land, as illustrated by Hannes Coudenys' *Ugly Belgian Houses*<sup>2</sup> project. This unbridled desire for individuality poses a fierce challenge to city living, which in response needs to become more inviting. Housing has a central place in the quest to renew and enhance urban quality of life, and answers to contempor-

ary challenges include introducing new layouts, foreseeing innovative relationships to the public realm, addressing the evolution of the household, or even developing alternative forms of land and property tenure.

If an analysis of housing spaces is central to this book, it is not without reason. Through the study of these spaces, the local lifestyles, uses, and dwelling practices are equally revealed. As David Harvey elegantly puts it, "we make the house and the house makes us".<sup>3</sup> By understanding the places we live in, we also come to understand ourselves. For people living in Brussels, there is an immediate interest in this knowledge. Knowing one's city better means understanding oneself better, while offering tools to help shape one's environment. For those who do not live there, this knowledge promotes a better understanding of a city and its identity, how it is inhabited, and how history is engraved on its spaces. This understanding of identity through domestic space can be compared with August Sander's work from the 1920s, *People of the 20<sup>th</sup> Century*,<sup>4</sup> a collective portrait of German society at that time in which attitudes and clothing indicated what kind of people were portrayed. Likewise, this book aims to give a better understanding of local habits and practices through the study of domestic spaces. In short, tell me where you live, and I will tell you who you are!

<sup>1</sup> "In architecture, the house is certainly what best characterises the customs, tastes and habits of a population; its layout, like its distribution, is only modified in the long run, and however powerful conquerors may be, their tyranny never goes so far as to attempt to change the houses of the conquered." (author's translation) In: Viollet-le-Duc, Eugène Emmanuel. *Dictionnaire raisonné de l'architecture française du XI<sup>ème</sup> au XVI<sup>ème</sup> siècle*. vol. 6. # A City of Row Houses: From the Origins to 1914

## From Rural to Urban Houses

In Roman times, Brussels did not yet exist; its territory consisted only of several secondary roads.<sup>1</sup> Three Gallo-Roman villas have been found in the area.<sup>2</sup> Although very little remains of these villas, we can nevertheless make certain observations: rural housing was set on ridges and slopes to avoid floods;<sup>3</sup> single-storey villas were organised around a large central room<sup>4</sup> opening onto a portico; and building materials included bricks, cob, and tiles.

Things changed after the fall of the Roman Empire. Wooden construction re-appeared, re-suming pre-Roman traditions.<sup>5</sup> The 19<sup>th</sup>-century architect Louis Cloquet<sup>6</sup> points out two other evolutions during this period: women were no longer isolated within houses, which now included large openings to the exterior.

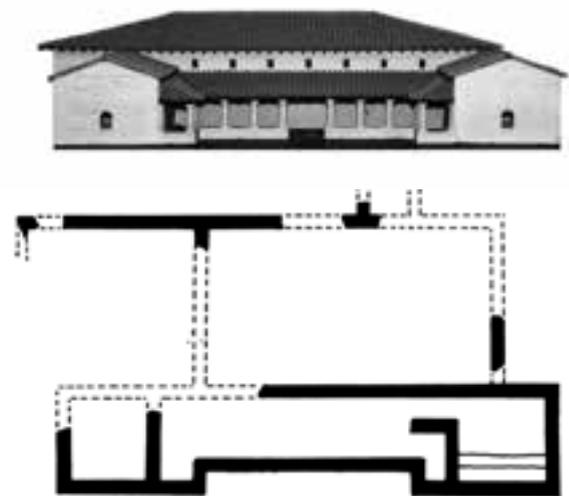

Two forms of housing could be found in Brussels in the early Middle Ages. On the one hand, peasant houses, common across the region, displayed a single large quadrangular space organised around a central family hearth.<sup>7</sup> Their construction was rudimentary, with wooden and cob walls capped by large thatched-ridge roofs.

On the other hand, local lords built stone houses – *steens* in Dutch. In the absence of city walls, these costly houses were designed to protect their residents, as suggested by their stone construction, central towers, and crenelated walls.<sup>8</sup> Such buildings consisted of several floors erected on vaulted basements. Texts mention

various *steens* in Brussels,<sup>9</sup> but none of these noble houses remains today; the last one was destroyed in 1910 during work on the north-south railway connection.<sup>10</sup>

## City Housing

Brussels was officially founded around 979,<sup>11</sup> when its first marketplace developed along the Senne River. The real turning point for housing, however, was the construction of the earliest city walls in the 12<sup>th</sup> century.<sup>12</sup> The aim at the time was to fit as many residents as possible behind the walls; buildings were therefore packed tightly together. In order to be accessible, houses

L-shaped brick housing from the 15<sup>th</sup> century

Hôtel Clèves-Ravenstein, pp. 50–51

Combining housing and covered passages

Galeries Royales Saint-Hubert, pp. 64–66  
Passage du Nord

# 1 Hôtel Clèves-Ravenstein

COMPLETION: Late 15<sup>th</sup> century to early 16<sup>th</sup> century

ARCHITECT: Unknown

ADDRESS: Ravensteinstraat 3 rue Ravenstein, 1000 Brussels

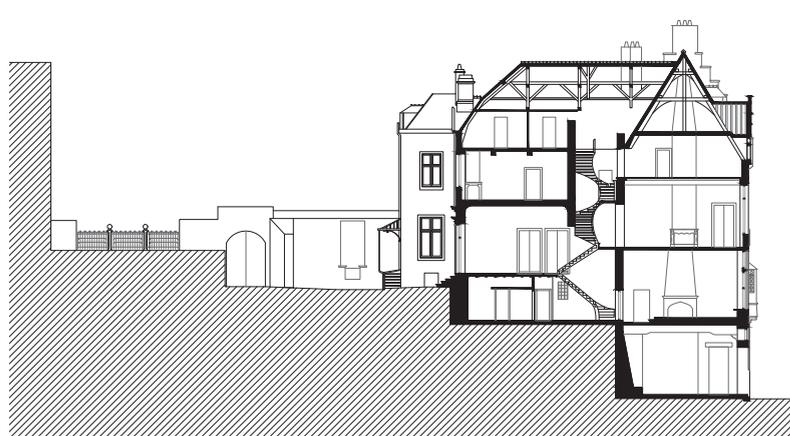

NUMBER OF UNITS: 1

UNIT FLOOR AREA: 1170 m<sup>2</sup> + courtyard 458 m<sup>2</sup>

HOUSING TYPE: Semi-detached house

This imposing brick building is one of the only town mansions remaining from the Burgundian period (see also pp. 30–31). It is positioned at the crossing of the very steep Rue Ravenstein and the smaller

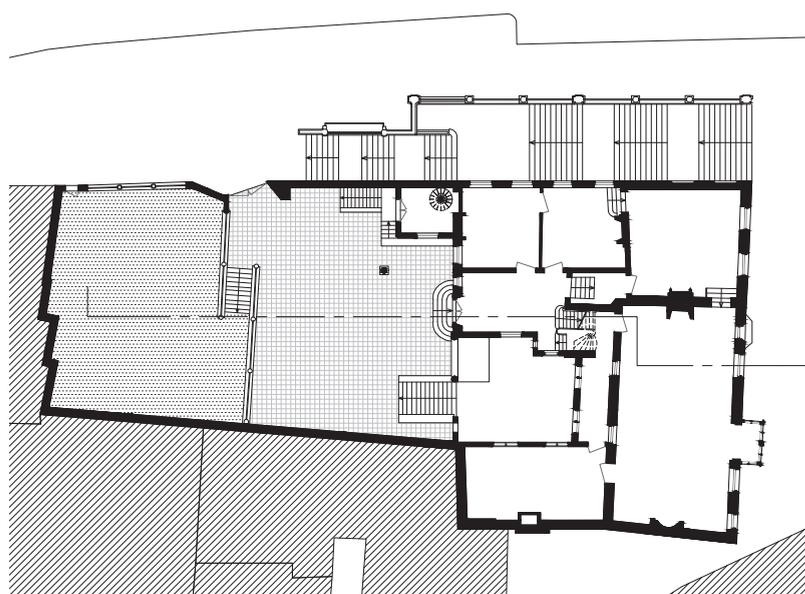

Rue des Sols that has now been cut off by Victor Horta's Centre for Fine Arts. The patrician house has four floors, complemented by two levels under an imposing wooden roof structure. It is a fine example of the L-shape typical of wealthy housing of the 15<sup>th</sup> century. This particular layout allows for greater façade development and the creation of a courtyard (a higher and a lower courtyard in this case because of the sloping ground). The staircase is positioned in the angle of the building. Therefore, all rooms are arranged in a row, as in most Renaissance buildings. The gothic façade is made of red bricks with chiselled sandstone for the building edges and to frame the windows, which are stone-mullioned. The building also features crenelated gables and two imposing, stone bay-windows on the side street.

# Perpetuating or Opposing the Terraced House

The bourgeois terraced house, Brussels' dominant housing type as documented in the preceding chapter, is not the city's only residential form. However, its importance in terms of numbers as well as in the city's collective unconscious has made it a benchmark against which to compare all other housing forms in the territory, including those that existed before. Comparing other residential forms with the standard form of housing allows us to understand why and how they appeared on the Brussels territory, both before and after the golden age of the Brussels terraced house at the turn of the 20<sup>th</sup> century. Hence, this chapter aims to offer a genealogy of such residential forms, organised according to spatial and typological features rather than chronologically. While some resemble the dominant – referential – type, others diverge partially or completely from it.

## Continuing the Terraced House

Two of these other forms of housing are directly related to the referential type: palaces consisting of multiple houses and houses built over a sunken garage.

### Palace of Houses

The earliest forms of social housing are consistent with the dominant type, producing only minor variations on its four basic spatial features yet often complementing them and producing a collective effect that goes beyond the individual house. The Cité Fontainas, pp. 134–135, next to the Porte de Hal, reflects this desire to create a unified setting for a group of modest dwellings.<sup>1</sup> Similar to Partoes' classical beguinage or English crescents, the building gives the illusion of living in a palace, which corresponds to the bourgeois image of the city.

Behind the façade of a palace stand a series of 16 terraced houses (Beyaert – Trappeniers, Cité Fontainas, 1867)

## Replacing Servants' Quarters in the Basement with Garages

At the end of the First World War, two changes had a direct impact on housing in Brussels. From a social point of view, home-based domestic servants were disappearing. From a technical point of view, the widespread use of the car modified people's relationship with public space as well as with individual housing, which now required garages.

These changes did not dramatically modify the standard housing type: garages replaced the servants' spaces in the sunken basement. Houses were set back from the street to allow access ramps for automobiles (Saint-Michel 97, pp. 162–163). In addition, with the disappearance of domestic servants, the kitchen migrated to an annex on the *bel étage*, where it had been in the Leopoldian Houses, p. 67, of the 19<sup>th</sup> century. These houses were built largely in the city's second belt, primarily in the east (Woluwé-St-Pierre, Woluwé-St-Lambert, Auderghem, etc.). They were built on plot widths similar to those used at the end of the 19<sup>th</sup> century and were likewise organised as closed city blocks. They reproduced the individual character, the limited height, and the repetitive layout of the referential type.

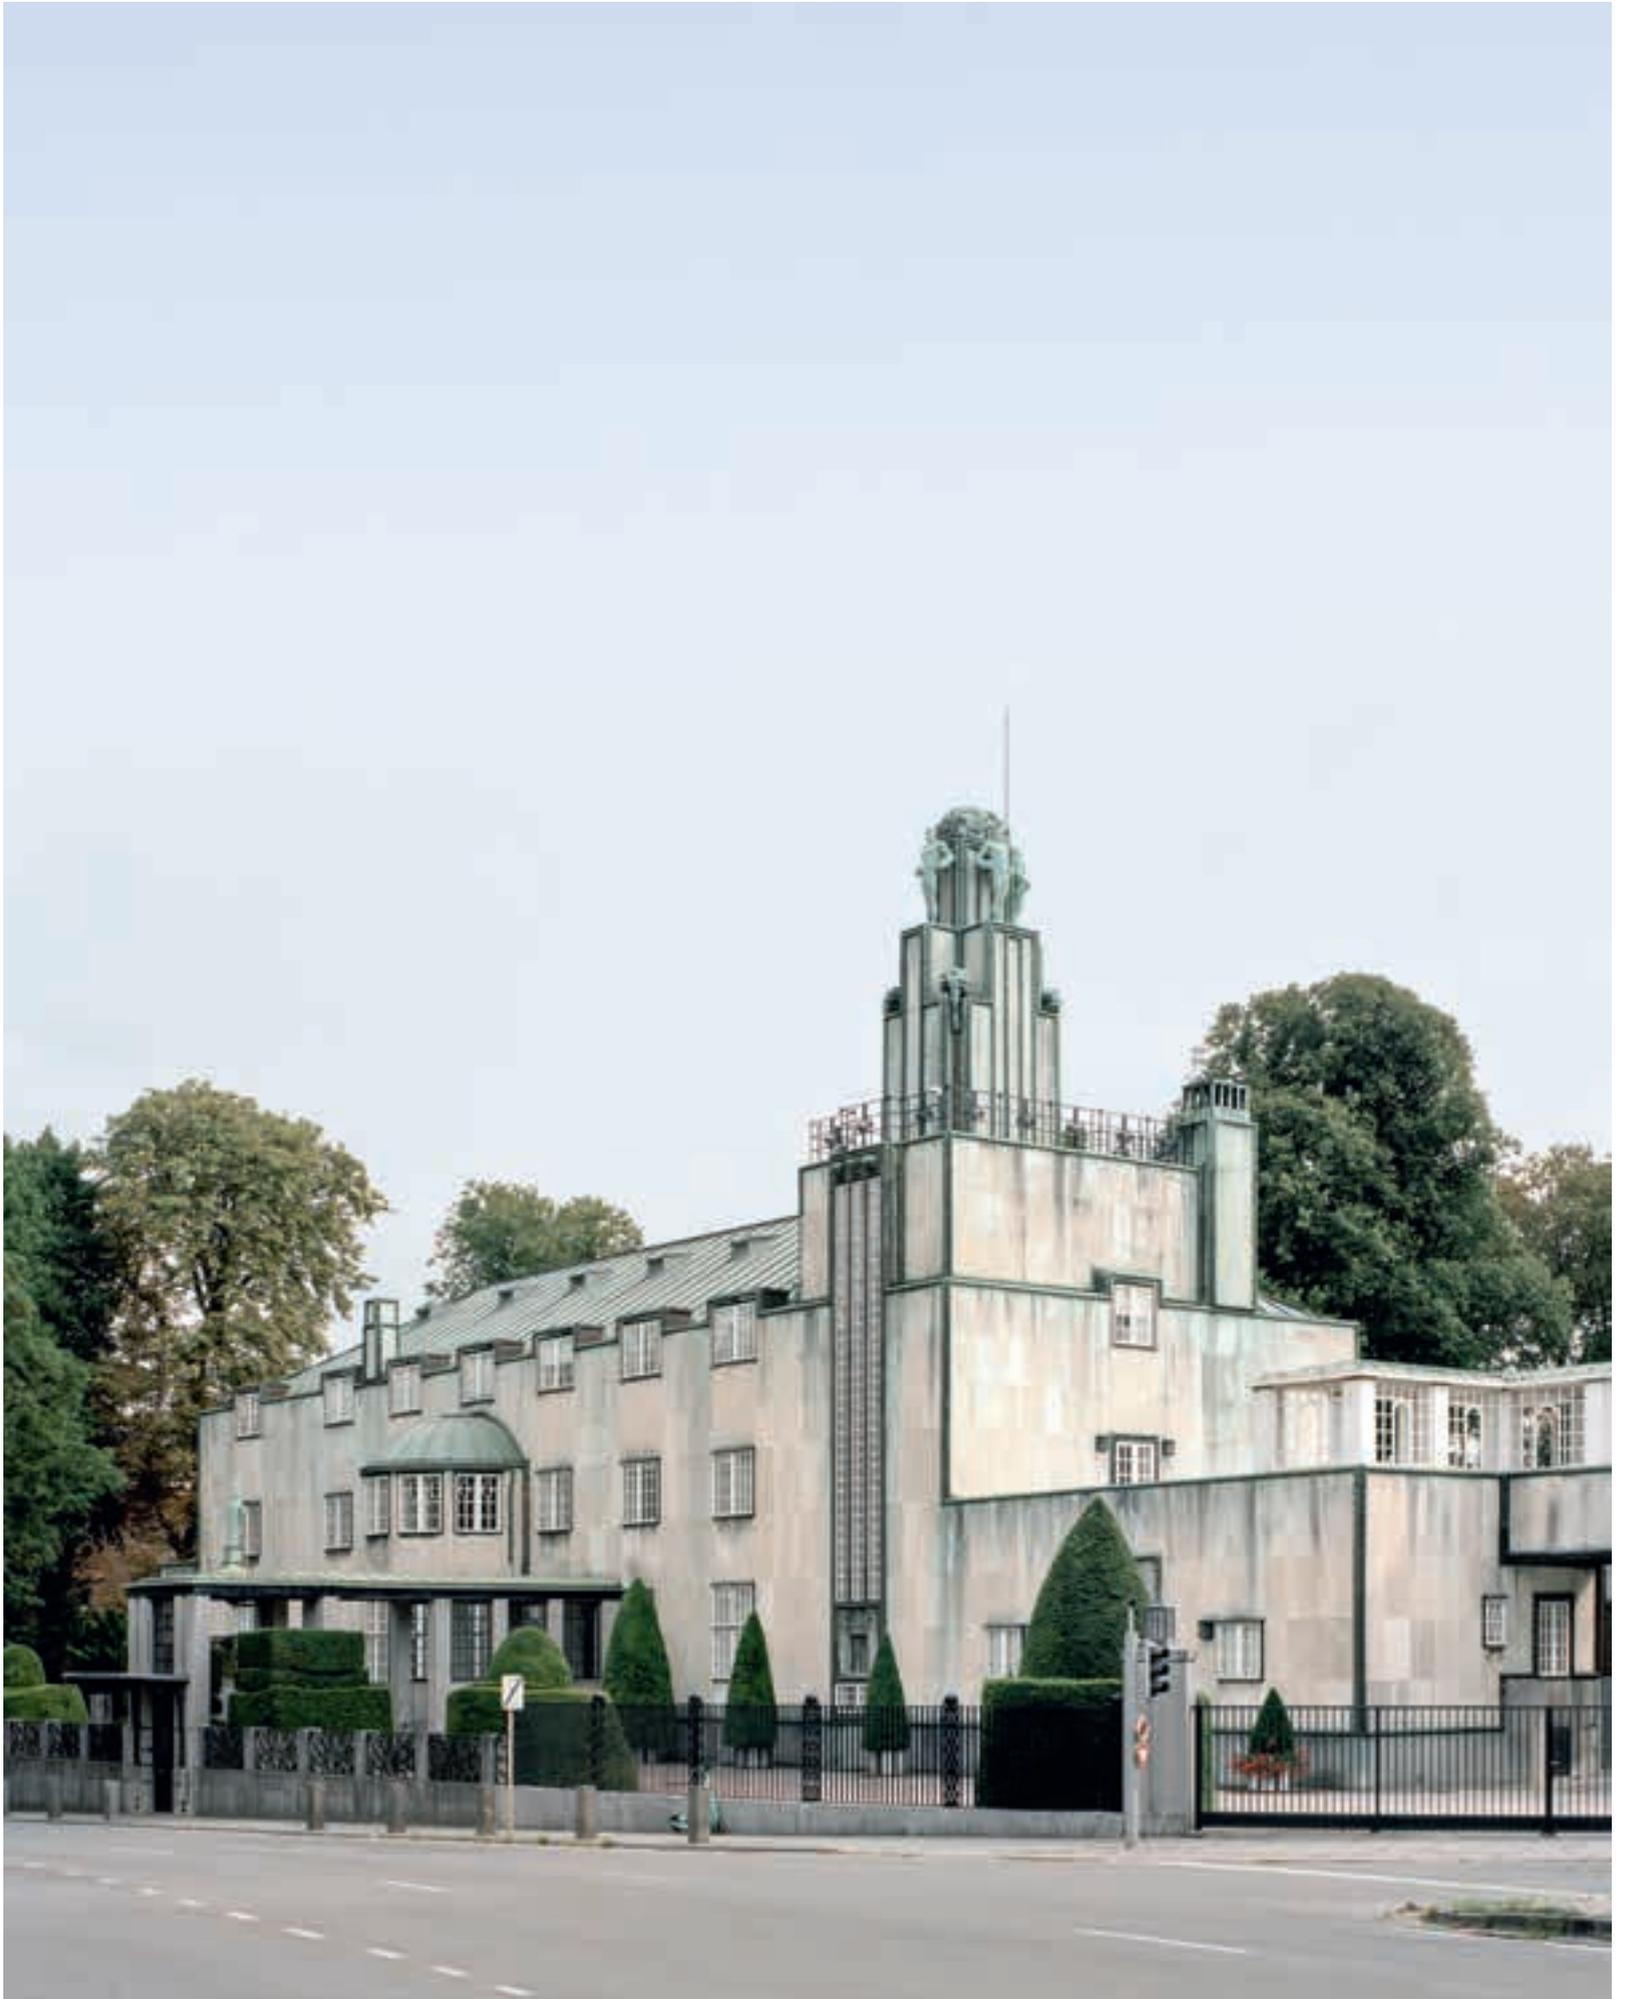

< A city of wide open green spaces (Tachtigbeukenlaan – avenue des Quatre-Vingts Hêtres)

### Individual modernist housing in the interwar period

Hôtel Wolfers, pp. 176–177

Maison de Verre, pp. 192–193

## 25 Cité Fontainas

COMPLETION: 1867

ARCHITECT: Antoine Trappeniers, Henri Beyaert

ADDRESS: Fontainashof 1–8 cité Fontainas,  
1060 Brussels

NUMBER OF UNITS: 32

UNIT FLOOR AREA: 134 m<sup>2</sup> + garden 143 m<sup>2</sup>

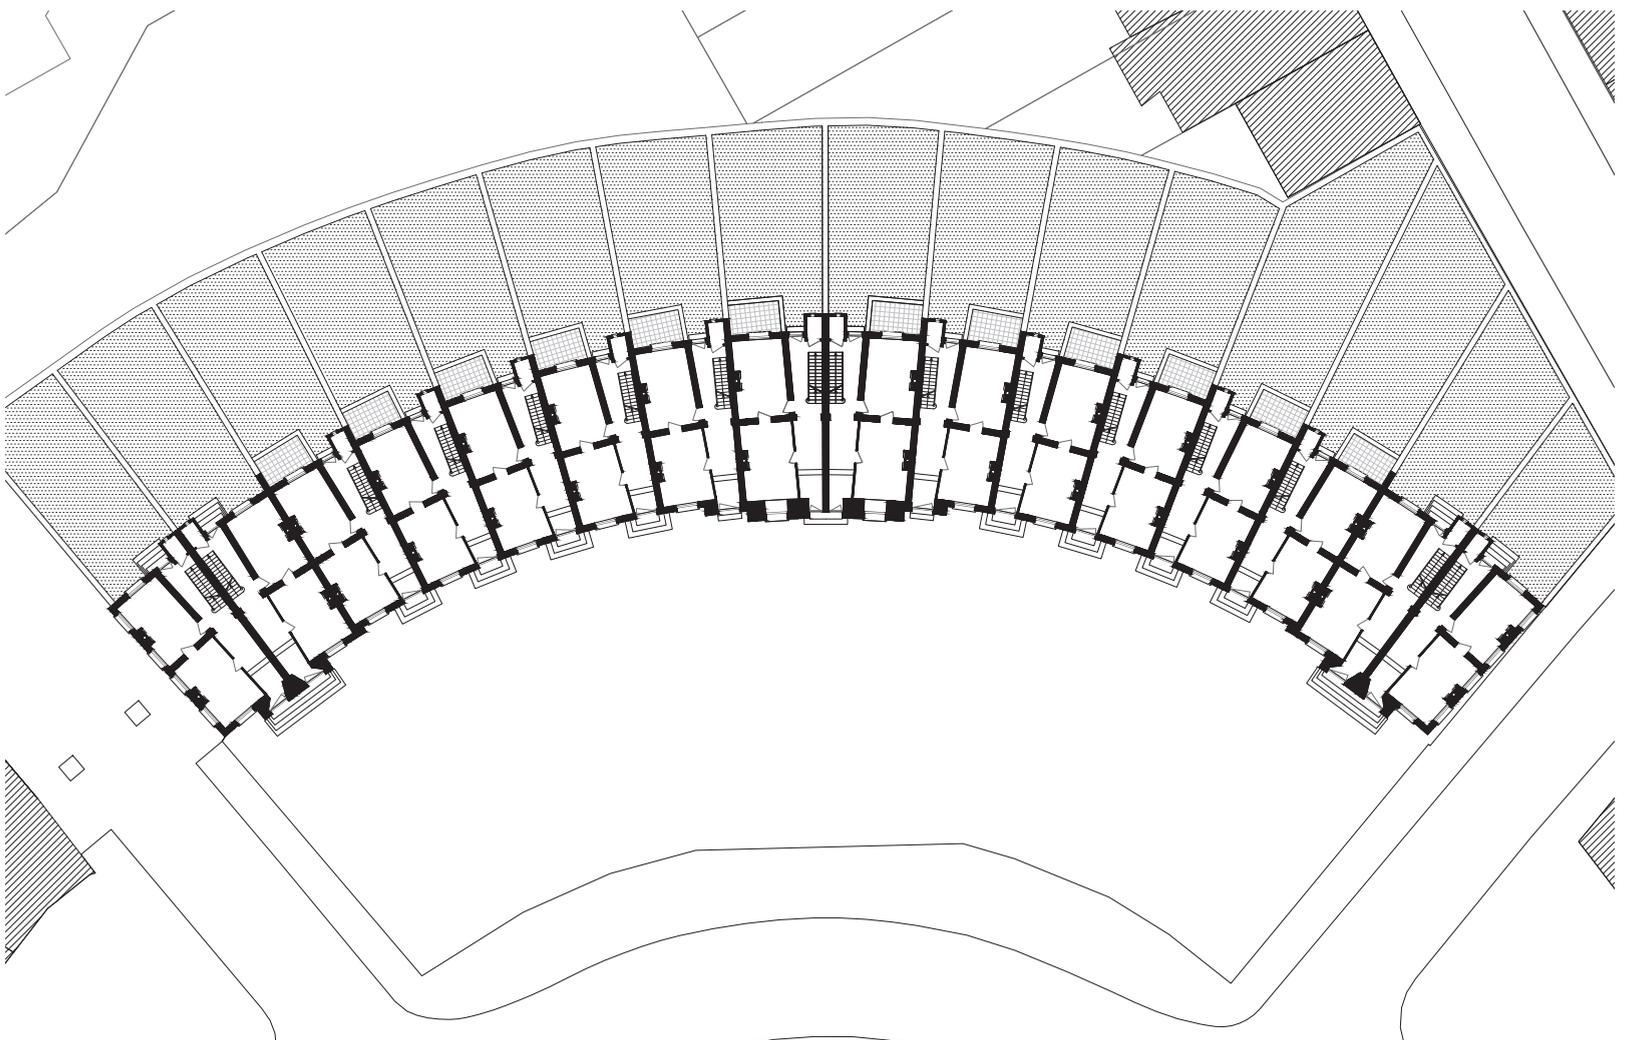

HOUSING TYPE: Terraced houses

This monumental neoclassical building is located close to the Hal Gate (see also pp. 114–115). It is surrounded by gardens closed off by wrought-iron fences. The wide entrance is flanked by two imposing carved blue-limestone pedestals bearing vases. The building was inspired by the English crescents, accommodating multiple dwellings behind a monumental façade. The housing estate comprises 16 houses, originally comprising 32 dwellings. They

were intended for Brussels' retired teachers. Each house is divided into two longitudinal bays, the narrower of which contains the staircase and a toilet; the wider bay has two adjoining rooms. The two-storey façade is topped by a slate roof punctuated by eight dormer windows. This façade is marked by three pavilions: one in the centre, the other two at the ends. Each pavilion features engaged columns on the first floor supporting an entablature. It is topped by a pediment surrounded by a balustrade. The central pediment shows a bas-relief representing André-Napoléon Fontainas (1807–1863), mayor of the city of Brussels, between two allegorical figures. The front façade is made of light-coloured stone, while the rear is plastered. Between the pavilions, the evenly spaced windows are interrupted every two bays by the entrance doors to the houses.

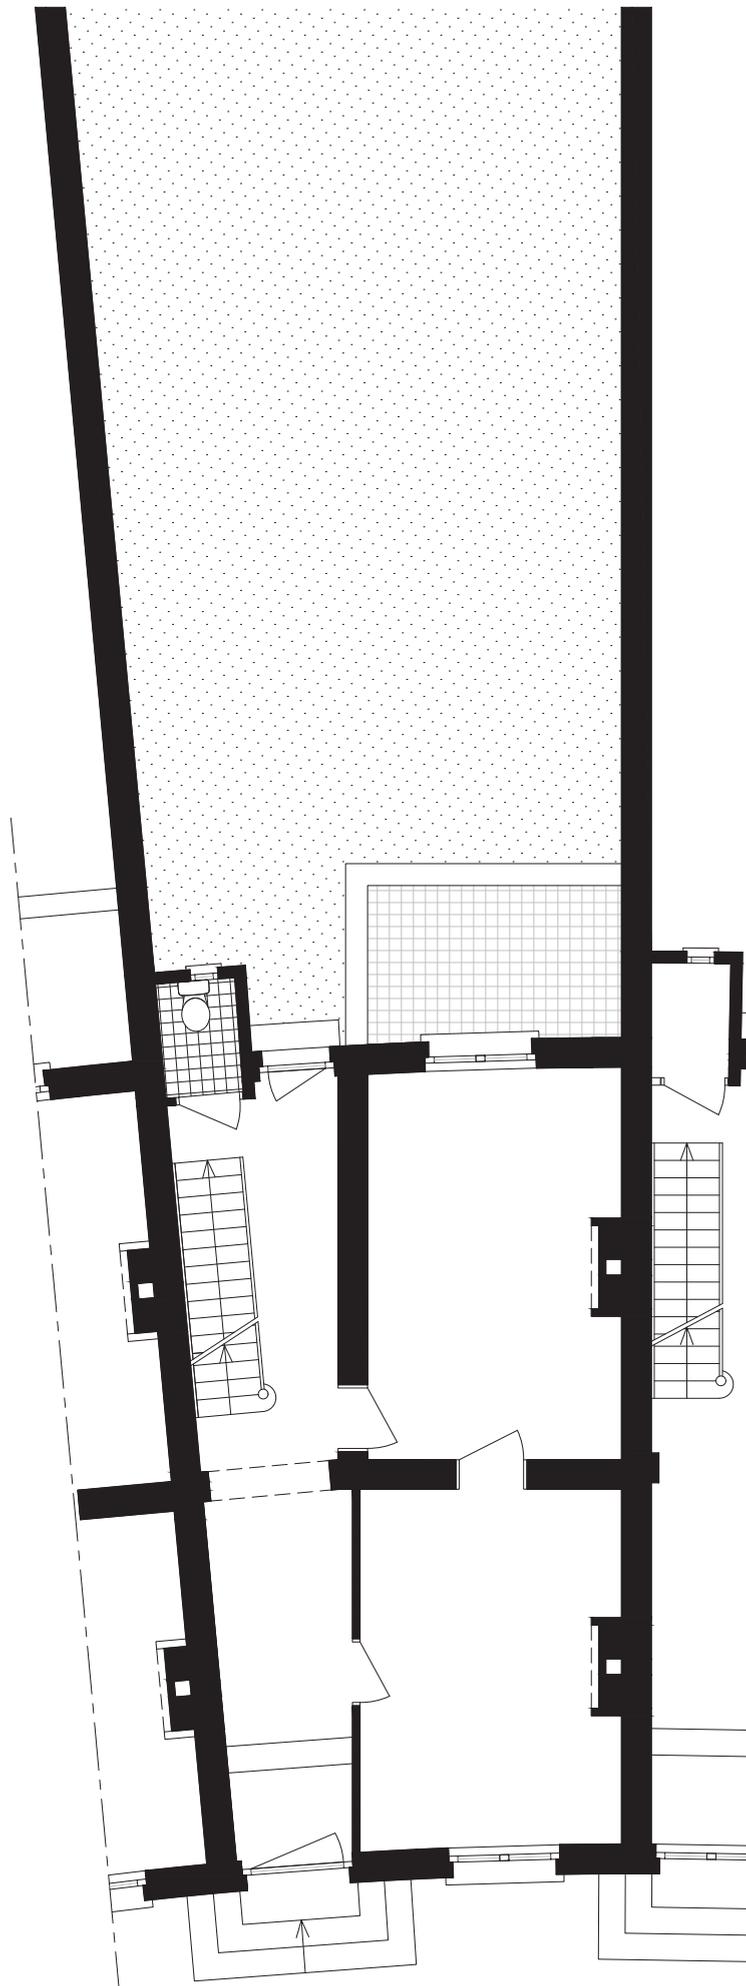

Façade 1:500

Ground floor plan 1:500

Unit plan 1:100

## 42 Hôtel Wolfers

COMPLETION: 1929

ARCHITECT: Henry Van de Velde

ADDRESS: Alphonse Renardstraat 60 rue Alphonse Renard, 1050 Brussels

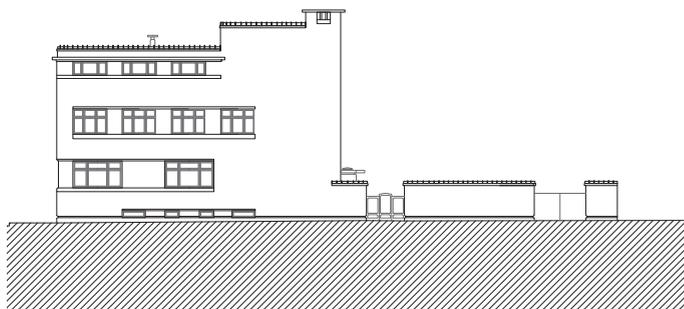

NUMBER OF UNITS: 1

UNIT FLOOR AREA: 772 m<sup>2</sup> + garden 245 m<sup>2</sup>, terraces 25 m<sup>2</sup>

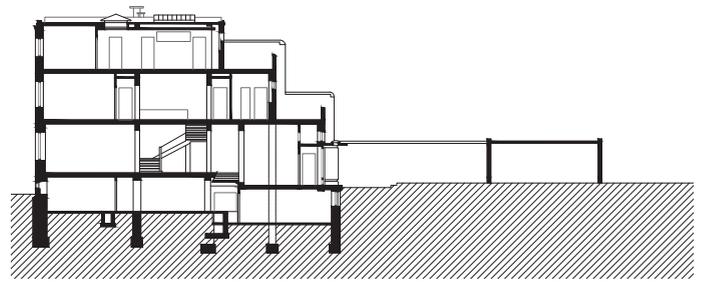

HOUSING TYPE: Semi-detached house

This corner house (see also p. 126), built for the master goldsmith and jeweller Raymond Wolfers, was erected on a funnel-shape plot of land. The building is extended by a garden designed by the landscape architect Lucien Boucher. It houses a double garage and it is closed off from the street by a brick wall. The house does not have a direct door to the street. It is accessed through a metal gate in

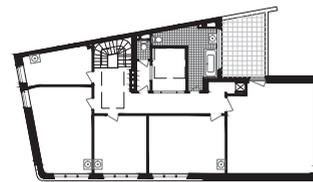

the garden wall that leads to an access path. The entrance to the house is located at the back of the plot under a canopy. It initiates a longitudinal service bay parallel to the party wall, which accommodates the circulation spaces including a main and a service staircase. On the street side, there is a row of three rooms: a dining room, a living room, and a music room. On the first floor there are three bedrooms, a boudoir, and two bathrooms as well as a terrace on the garden side. On the second floor there are four bedrooms, a gym, and a second terrace. The three-storey building under flat roofs offers a play of recessed volumes. The façades are made of light-brown bricks on a blue-limestone base. They are ornamented with wall-finishing black-glazed brick as well as green wooden shutters and canopies. Today, the residence is home to the artist Richard Venlet who has decided to let the building age without intervention.

## 61 Centre International Rogier

COMPLETION: 1961

DEMOLITION: 2001

ARCHITECT: Jacques Cuisinier, Serge Lebrun

ADDRESS: Karel Rogierplein 10–15 place Charles Rogier, 1210 Brussels

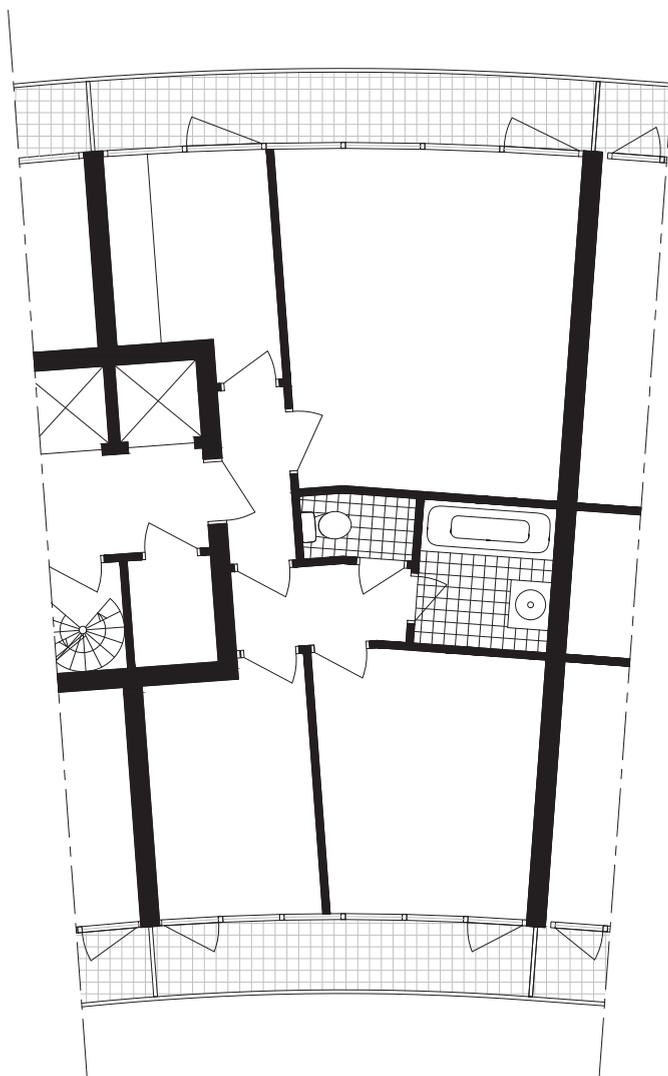

NUMBER OF UNITS: 120

UNIT FLOOR AREA: 57 m<sup>2</sup> + terrace 11 m<sup>2</sup>

HOUSING TYPE: Multi-use apartment building

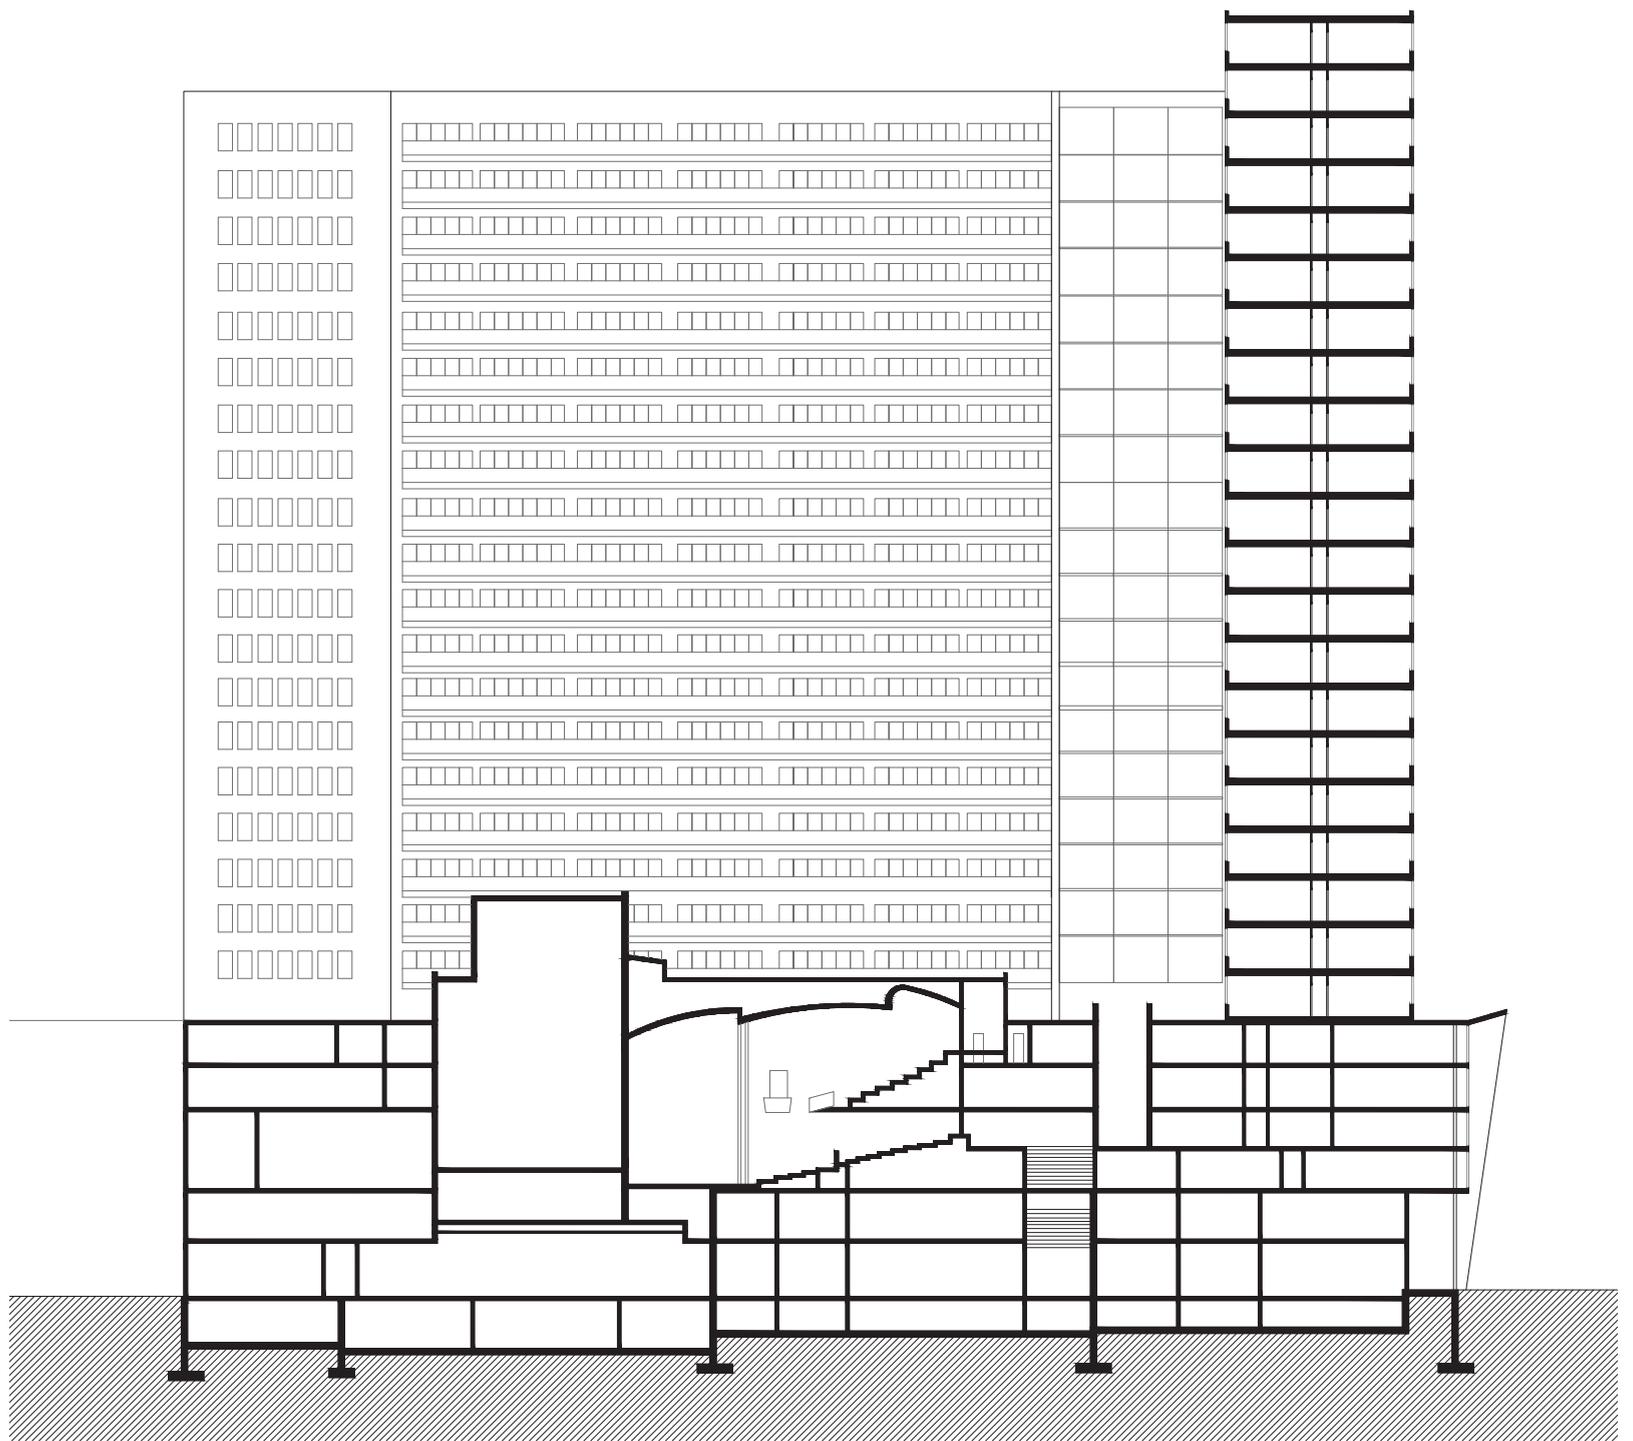

Also known as the Martini Tower after the bar it housed on its top floor, this building was undoubtedly one of the most emblematic examples of post-war modernism in Brussels. Located on Place Rogier, one of the main squares on the city's inner ring road, the tower was built on the site of the former Gare du Nord, which was moved a few hundred

metres further north. The volume of the building developed in three stages: a two-storey-high gallery and a four-storey base topped by a 22-storey tower. With its eclectic programme, the more than 60,000 m<sup>2</sup> building was a real city within the city: it accommodated shops, exhibition and conference rooms, offices, and housing, as well as two performance halls for the Théâtre National. On the ground floor, a Y-shaped gallery ran through the building. In addition to serving shops, this gallery also gave access to the apartments found in the rear part of the tower. These dwellings were organised in pairs around the vertical cores. Benefiting from balconies running continuously along the front and rear façades, the apartments were organised along two poles: bedrooms to the west and living rooms linked to the kitchens to the east. In terms of façades, the building's load-bearing concrete structure was fitted with glass-and-aluminium curtain walls.

Cross section 1:500

Alessandro Porotto

# The Search for Quality Housing: From 2000 onwards

## Envisioning Brussels in the 21<sup>st</sup> Century

Over the past two decades, housing has once again become a matter of urgent debate. Challenges brought about by a series of crises and changes that began in the 20<sup>th</sup> century have required the development and implementation of new strategies. This is the situation that any innovative housing agenda must face as we transition into the 21<sup>st</sup> century.<sup>1</sup>

## Issues Inherited from the 20<sup>th</sup> Century

Fragmented government meant 20<sup>th</sup>-century Brussels lacked coherent urban-planning policies. Planning, even for such sizeable sites as the European Quarter and the Northern Quarter, responded to local development opportunities rather than following any overall structural plan. While some post-war housing is remarkable, the post-war period nevertheless left a complex legacy at the beginning of the 2000s that must be taken into account.

From an urban point of view, a typological genealogy of overlapping housing types resulted in an extremely fragmented built environment. Indeed, from the 1950s onwards the state strongly encouraged Belgians to leave the city, promoting suburbanisation and the building of so-called *pavillonnaires* – groups of detached houses in suburban settings. The resulting urban sprawl turned the Brussels-Capital Region into a “horizontal metropolis”, a concept defining extended urban spaces characterised by complementarity, loose hierarchies, and territorial synergies.<sup>2</sup> In

terms of the built environment, housing in this metropolis extended across administrative boundaries, creating on the one hand the compact city described in this book, and on the other the surrounding Brussels hinterland.

From a social point of view, this suburbanisation generated a massive exodus, so that while the population in the urban agglomeration continued to grow from 1965 onwards, this growth was outside the Brussels region.<sup>3</sup> International immigration, meanwhile, was unable to compensate for internal emigration, bringing about a slow yet persistent population decline. This trend was reversed in the Brussels-Capital Region from 1995 onwards, and the population is expected to increase progressively into the 21<sup>st</sup> century.<sup>4</sup> Furthermore, new types of households emerged in the 2000s as the result of demographic evolution and migration;<sup>5</sup> these took their place alongside the nuclear family, which had been the central model for post-war initiatives.

From an economic point of view, housing became very expensive for the middle class in the years leading up to 2000, while social-housing production was drastically reduced after the 1970s.<sup>6</sup> In particular, the establishment of the Capital Region’s borders initiated residential relocation away from Brussels, forcing many young families to migrate in order to reduce their cost of living. In terms of affordability, therefore, housing alternatives were required to provide a larger, higher-quality housing offer that also accommodated new social structures. New housing policies needed tools that could establish conditions allowing denser occupancy in quality urban homes. In essence, they were forced to answer the question: how can people live in the city today?

1 Porotto, Alessandro and Gérald Ledent. “Crisis and Transition: Forms of Collective Housing in Brussels.” *Buildings*, vol. 11, no. 4, 162, 2021, pp. 1–31. 2 The concept of “horizontal metropolis” as defined by Studio Bernardo Secchi and Paola Viganò emerged in the study *Brussels 2040*. Dejemeppe, Pierre and Benoit Périlleux. *Bruxelles 2040*. ## 76 P.NT<sup>2</sup>

COMPLETION: 2007

ARCHITECT: BOB361 Architects (original architect: J. Schockaert)

ADDRESS: Poincarélaan 28–31 boulevard Poincaré, 1070 Brussels

NUMBER OF UNITS: 18

UNIT FLOOR AREA: 176 m<sup>2</sup> + terrace 86 m<sup>2</sup>

HOUSING TYPE: Co-housing apartment building

This project (see also p. 260) stems from the transformation of former goldsmithies located on Brussels' inner ring road. Starting from a group of very dense buildings, several demolitions created a suitable environment for 18 dwellings, offices, and a commercial space organised around four outdoor areas. On the boulevard, there is a commercial space and the entrance to the site. Behind this first threshold,

a semi-public paved courtyard serves the office spaces of the architectural studio BOB361. Further in, a private garden is shared by all the dwellings while two smaller green spaces form the heart of the northernmost apartments. On the upper floors, the dwellings are accommodated in the old industrial structures, producing a great typological and spatial variety. Their spaces are spread over large areas and are completed by terraces between green roofs. Several communal spaces are provided, such as a summer kitchen in the collective garden and a bicycle room. The original façades of the buildings are mostly in red brick, while the new additions are mainly in concrete both inside and outside. All the window frames are made of wood except for those of elements such as greenhouses, which recall the industrial character of the site. In the first courtyard, holes have been cut in the concrete floor, which are used to create a passageway to the first garden.

Brussels housing is extremely diverse, as anyone walking around the city will readily appreciate. Its traditional urban block consists of single-family terraced houses, usually two to three storeys high and with a garden at the rear. Here, this bourgeois housing type evolved into a particularly broad range - including the well-known Art Nouveau residences - and still forms the “DNA” of the city. Today, many other housing forms have emerged in the city; thus, Brussels’ residential building types comprise narrow gabled-roofed houses standing side by side with modernist apartment buildings, 19<sup>th</sup>-century mansions, and brand new condominiums. This typical Belgian layering of housing solutions makes for a visually poetic chaos, creating at times a surreal cityscape but also providing answers for the challenges of housing design.

The three chapters of this publication explore Brussels’ housing typologies from the origins of the city to the present day. More than 100 selected case studies are documented with scaled drawings and photographs. The works by photographer Maxime Delvaux trace a promenade comprising an expressive journey through the Belgian capital and its varied cityscapes. The book offers a broad panorama and a history of the architecture and urban development of Brussels.
